

SmartCommute

Your smarter route. Your greener journey.

UI/UX Design Project Documentation

Project	SmartCommute
Project Type	Mobile UI/UX Prototype
Design Tool	Figma
Focus	Smart, economical and sustainable commuting

1. Problem Statement

College students often face difficulty choosing the most suitable transportation option for daily commuting. They may lose time in traffic, spend more money than necessary, and have limited awareness of the environmental impact of different travel choices. Many navigation experiences focus primarily on route and travel time rather than presenting time, cost, and sustainability together in a student-friendly interface.

2. Proposed Solution

SmartCommute is a student-focused mobile application concept that compares transportation choices such as bus, car, cycle, and walking. The interface presents travel time, estimated cost, and an Eco Score so users can select an option according to their personal priority. The prototype also includes journey tracking and completion feedback.

3. Objectives

- 1. Compare multiple transportation options in one interface.
- 2. Help students identify faster and more convenient routes.
- 3. Support cost-conscious commuting decisions.
- 4. Encourage eco-friendly transportation choices.
- 5. Provide a simple and intuitive mobile user experience.

4. Key Features

- Smart Route Search:** Users enter their starting point and destination.
- Travel Preferences:** Fastest, Cheapest, Eco-Friendly, and Balanced options.
- Route Comparison:** Bus, car, cycle, and walking options are presented with time, cost, and Eco Score.
- Journey Tracking:** Shows route progress, distance, travel time, and estimated environmental benefit.
- Journey Completion:** Summarizes the completed trip with distance, time, money saved, CO₂ saved, and Eco Points.

5. Innovation

The main innovation is the combination of **Time + Cost + Eco Score** in a single route-comparison experience. Instead of selecting a route only by speed, users can make a more informed decision based on convenience, affordability, and sustainability. The preference system further personalizes the comparison.

6. User Flow

1	Splash Screen
2	Login
3	Home Dashboard
4	Route Search & Preferences

5	Route Comparison
6	Journey Tracking
7	Journey Completed

7. UI/UX Screens Designed

The Figma prototype contains seven main screens designed as a connected mobile user journey.

01	Splash Screen	Introduces the SmartCommute concept.
02	Login Screen	Provides entry into the application.
03	Home Dashboard	Provides destination search, impact summary, quick actions, and navigation.
04	Route Search	Collects source, destination, and travel preference.
05	Route Comparison	Compares transport options using time, cost, and Eco Score.
06	Journey Tracking	Shows the active journey and trip details.
07	Journey Completed	Displays the final trip summary and eco-friendly feedback.

8. Route Comparison Example

Transport	Cost	Time	Eco Score
Bus	■15	35 min	85/100
Car	■80	25 min	40/100
Cycle	■0	40 min	100/100
Walk	■0	70 min	100/100

9. SDG Alignment

SDG 11 – Sustainable Cities and Communities: SmartCommute supports sustainable and efficient mobility by helping users compare transportation choices.

SDG 13 – Climate Action: Eco Score and CO■-saving feedback encourage users to consider lower-impact transportation options.

10. Expected Benefits

The concept aims to help students make quicker, more economical, and more environmentally responsible commuting decisions. It also provides a clear, simple interface that reduces the effort required to compare travel options.

11. Tools Used

- Figma – UI design and interactive prototype
- Canva – Supporting visual design, if required

12. Conclusion

SmartCommute provides a focused solution for everyday student commuting by combining route selection with travel time, estimated cost, and environmental impact. The prototype demonstrates a complete user flow from login and route discovery to journey tracking and completion, while keeping the interface simple and visually consistent.
